

# Tracking Problems

Andreas Zeller

# What's a problem?

- A *problem* is a questionable property of a program run
- It becomes a *failure* if it's incorrect...
- ...a *request for enhancement* if missing...
- ...and a *feature* if normal behavior.

*It's not a bug, it's a feature!*

# Problem Life Cycle

- The user *informs* the vendor about some problem.
- The vendor
  1. *reproduces* the problem
  2. *isolates* the circumstances
  3. *locates* and *fixes* the defect
  4. *delivers* the fix to the user.

# Vendor Challenges

- How do I organize the life cycle?
- Which problems are currently open?
- Which are the most severe problems?
- Did similar problems occur in the past?

# User Challenges

Solve my problem!

# Problem Report

- A problem comes to life with a *problem report*.
- A problem report includes all the information the vendor needs to fix the problem.
- Also known as *change request* or *bug report*.

# Problem report #1

From: me@dot.com

To: zeller@gnu.org

Subject: Crash

Your program crashed. (core dumped)

# Problem report #2

From: me@dot.com  
To: zeller@gnu.org  
Subject: Re: Crash

Sorry, here's the core - cu

<core, 14MB>

# Problem report #3

From: me@dot.com  
To: zeller@gnu.org  
Subject: Re: Crash

You may need that, too (just in case)

<drive\_c.zip, 148GB>

# What to report

- The *product release*
- The *operating environment*
- The *problem history*
- *Expected and experienced behavior*
- A one-line *summary*

# Product Release

- Typically, some *version number* or otherwise unique identifier
- Required to *reproduce the exact version*:  
Perfect Publishing Program 1.1 (Build 7E47)
- Generalize: Does the problem occur only in this release?

# Operating Environment

- Typically, *version information* about the operating system
- Can be simple (“Windows 98 SE”) or complex (“Debian Linux ‘Sarge’ with the following packages...”)
- Generalize: In which environments does the problem occur?

# Problem History

- Steps needed to *reproduce* the problem:
  1. Create “bug.ppp”
  2. Print on the default printer...
- If the problem cannot be reproduced, it is unlikely to be fixed
- Simplify: Which steps are relevant?

# Expected Behavior

- What should have happened according to the user:

The program should have printed the document.

- Reality check: What's the understanding of the user?

# Observed Behavior

- The *symptoms* of the problem — in contrast to the *expected* behavior

The program crashed with the following information

```
*** STACK DUMP OF CRASH (LemonyOS)
```

```
Back chain  ISA  Caller
00000000    SPC  0BA8E574
03EADF80    SPC  0B742428
03EADF30    SPC  0B50FDDC  PrintThePage+072FC
SnicketPC unmapped memory exception at
          0B512BD0  PrintThePage+05F50
```

# A one-line summary

- Captures the essential of the problem  
PPP 1.1 crashes when printing

# Things to avoid

- Humor

PPP (oops, gotta go to the restroom :-) ...

- Sarcasm

Here's yet another "never-to-be-fixed" bug

- Attacks

If you weren't too incompetent to grasp...

# All these Problems

- 001 It's too big and too slow. [This one will never get fixed]
- 003 (Motif 1.1) The command window is scrolled whenever obscured.
- 021 (DBX) Using SunOS DBX, attempting to dereference a `(nil)` pointer results in an error message and no new display. However, the expression is entered as an ordinary display.
- 026 (DBX) Using SunOS DBX with PASCAL or Modula-2, selected array elements are not counted from the starting index of the array.
- 041 Starting a multi-window DDD iconified under vtwm and fvwm causes trouble with group iconification.
- 272 (LessTif) The `select' font selection method works only once.
- 281 In auto deiconify mode, the Debugger Console uniconifies even if other DDD windows are already there.
- 286 (Motif) Changing Cut/Copy/Paste accelerators at runtime does not work.

# Managing Problems

- *Alternative #1: A Problem File*
  - Only one person at a time can work on it
  - History of earlier (fixed) problems is lost
  - Does not scale
- *Alternative #2: A Problem Database*

Bugzilla Version 2.17

This is Bugzilla: the Mozilla bug system. For more information about what Bugzilla is and what it can do, see mozilla.org's bug pages.

OS: All Windows 3.1 Windows 95 Windows 98 Windows ME Windows 2000 Windows NT

# Classifying Problems

- Severity
- Priority
- Identifier
- Comments
- Notification

# Severity

**Enhancement.** A desired feature.

**Trivial.** Cosmetic problem.

**Minor.** Problem with easy workaround.

**Normal.** “Standard” problem.

**Major.** Major loss of function.

**Critical.** Crashes, loss of data or memory

**Showstopper.** Blocks development.

# Priority

- Every new problem gets a *priority*
- The higher the priority, the sooner the problem will be addressed
- Priority is independent from severity
- Prioritizing problems is the main tool to control development and problem solving

# Identity

- Every new problem gets an *identifier* (also known as *PR number* or *bug number*)
- The identifier is used in all documents during the debugging process:

Subject: PR #3427 is fixed?

# Comments

- Every developer can attach *comments* to a problem:

I have a patch for this. It's just an uninitialized variable but I still need a review.

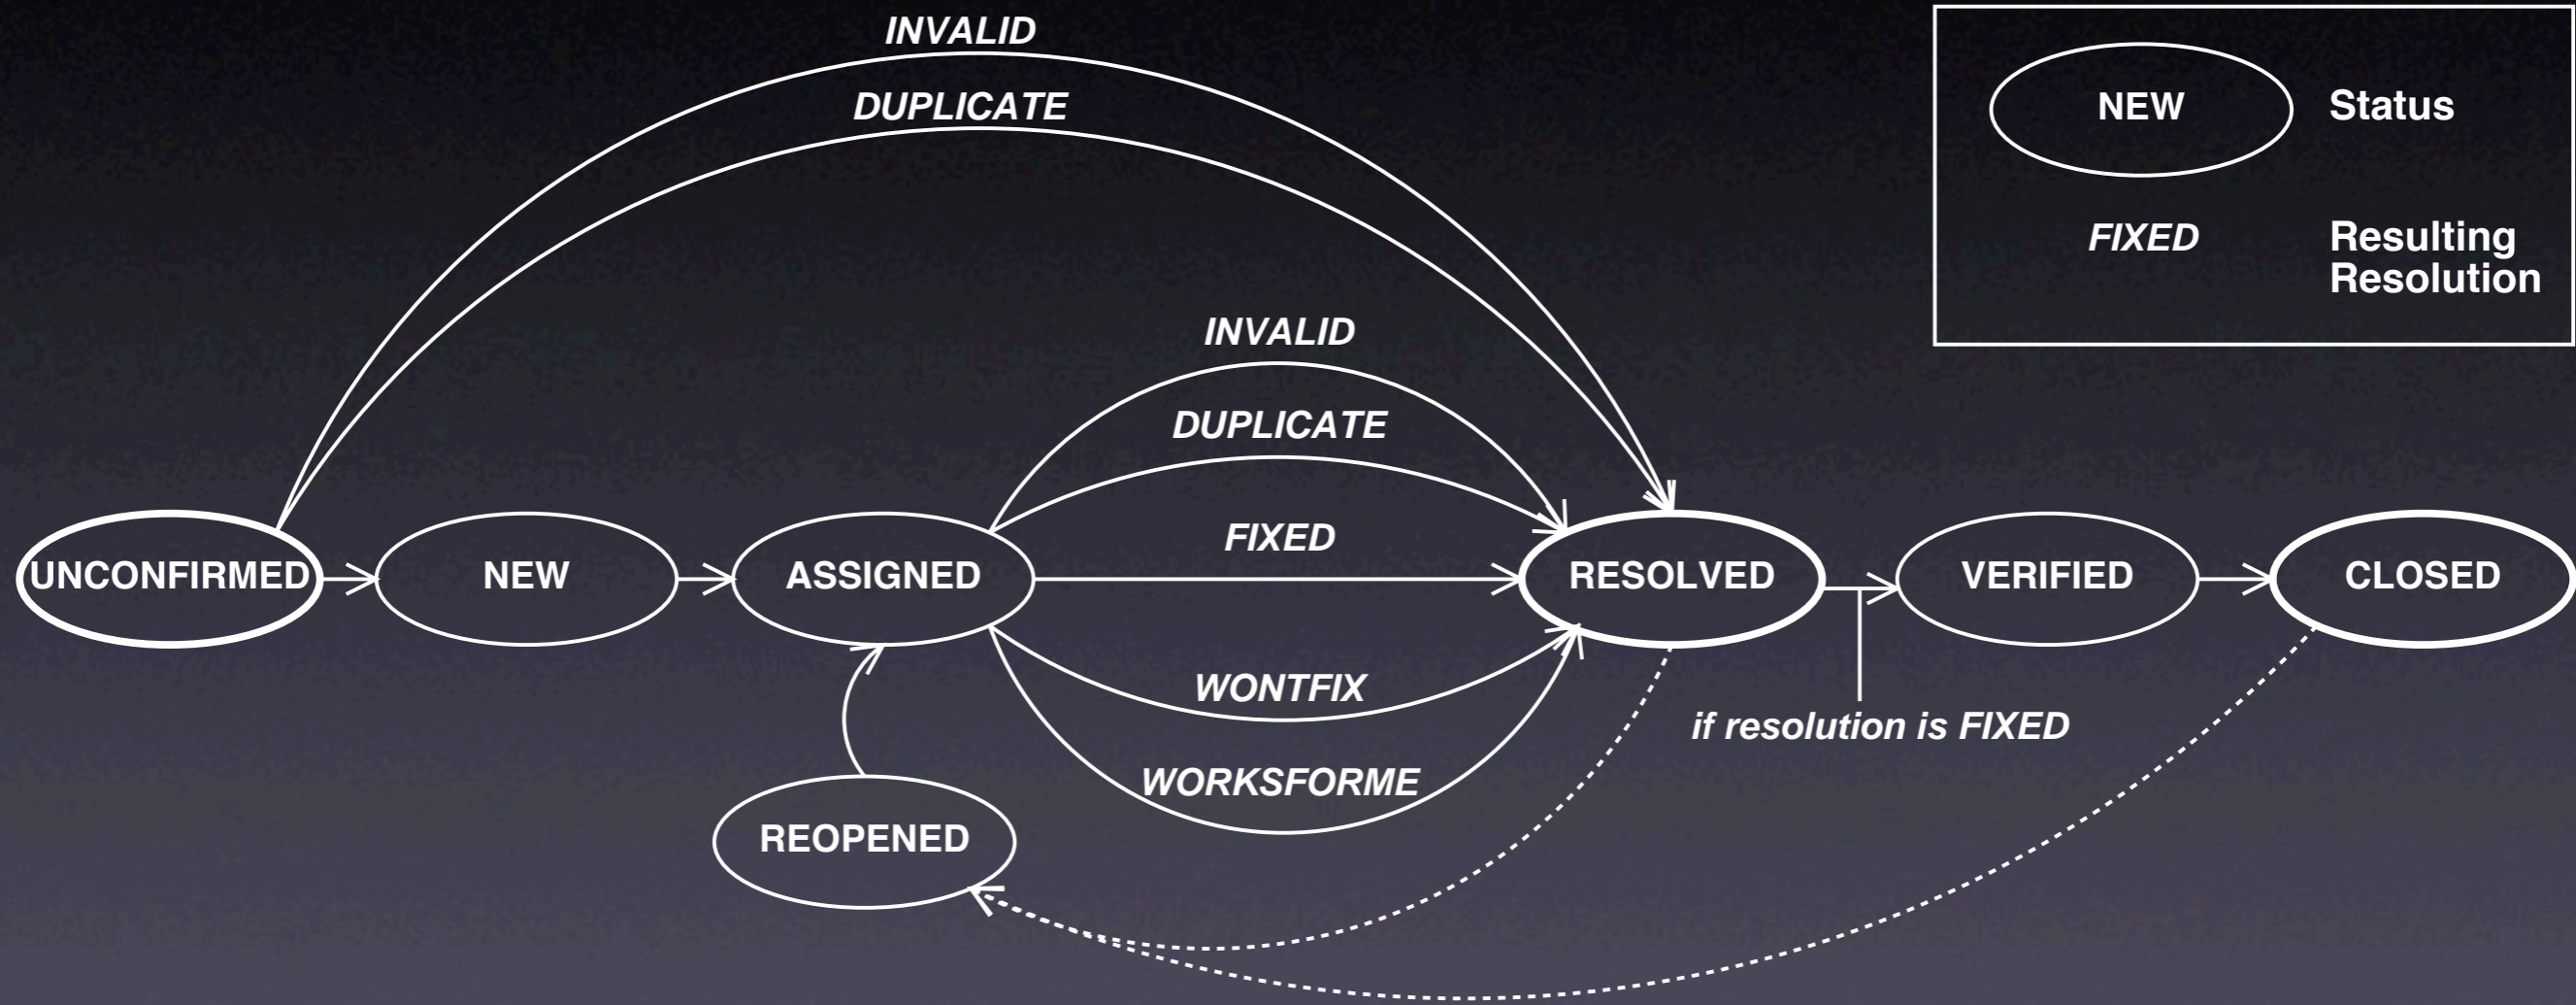

- Comments may also include files, documents, etc.

# Notification

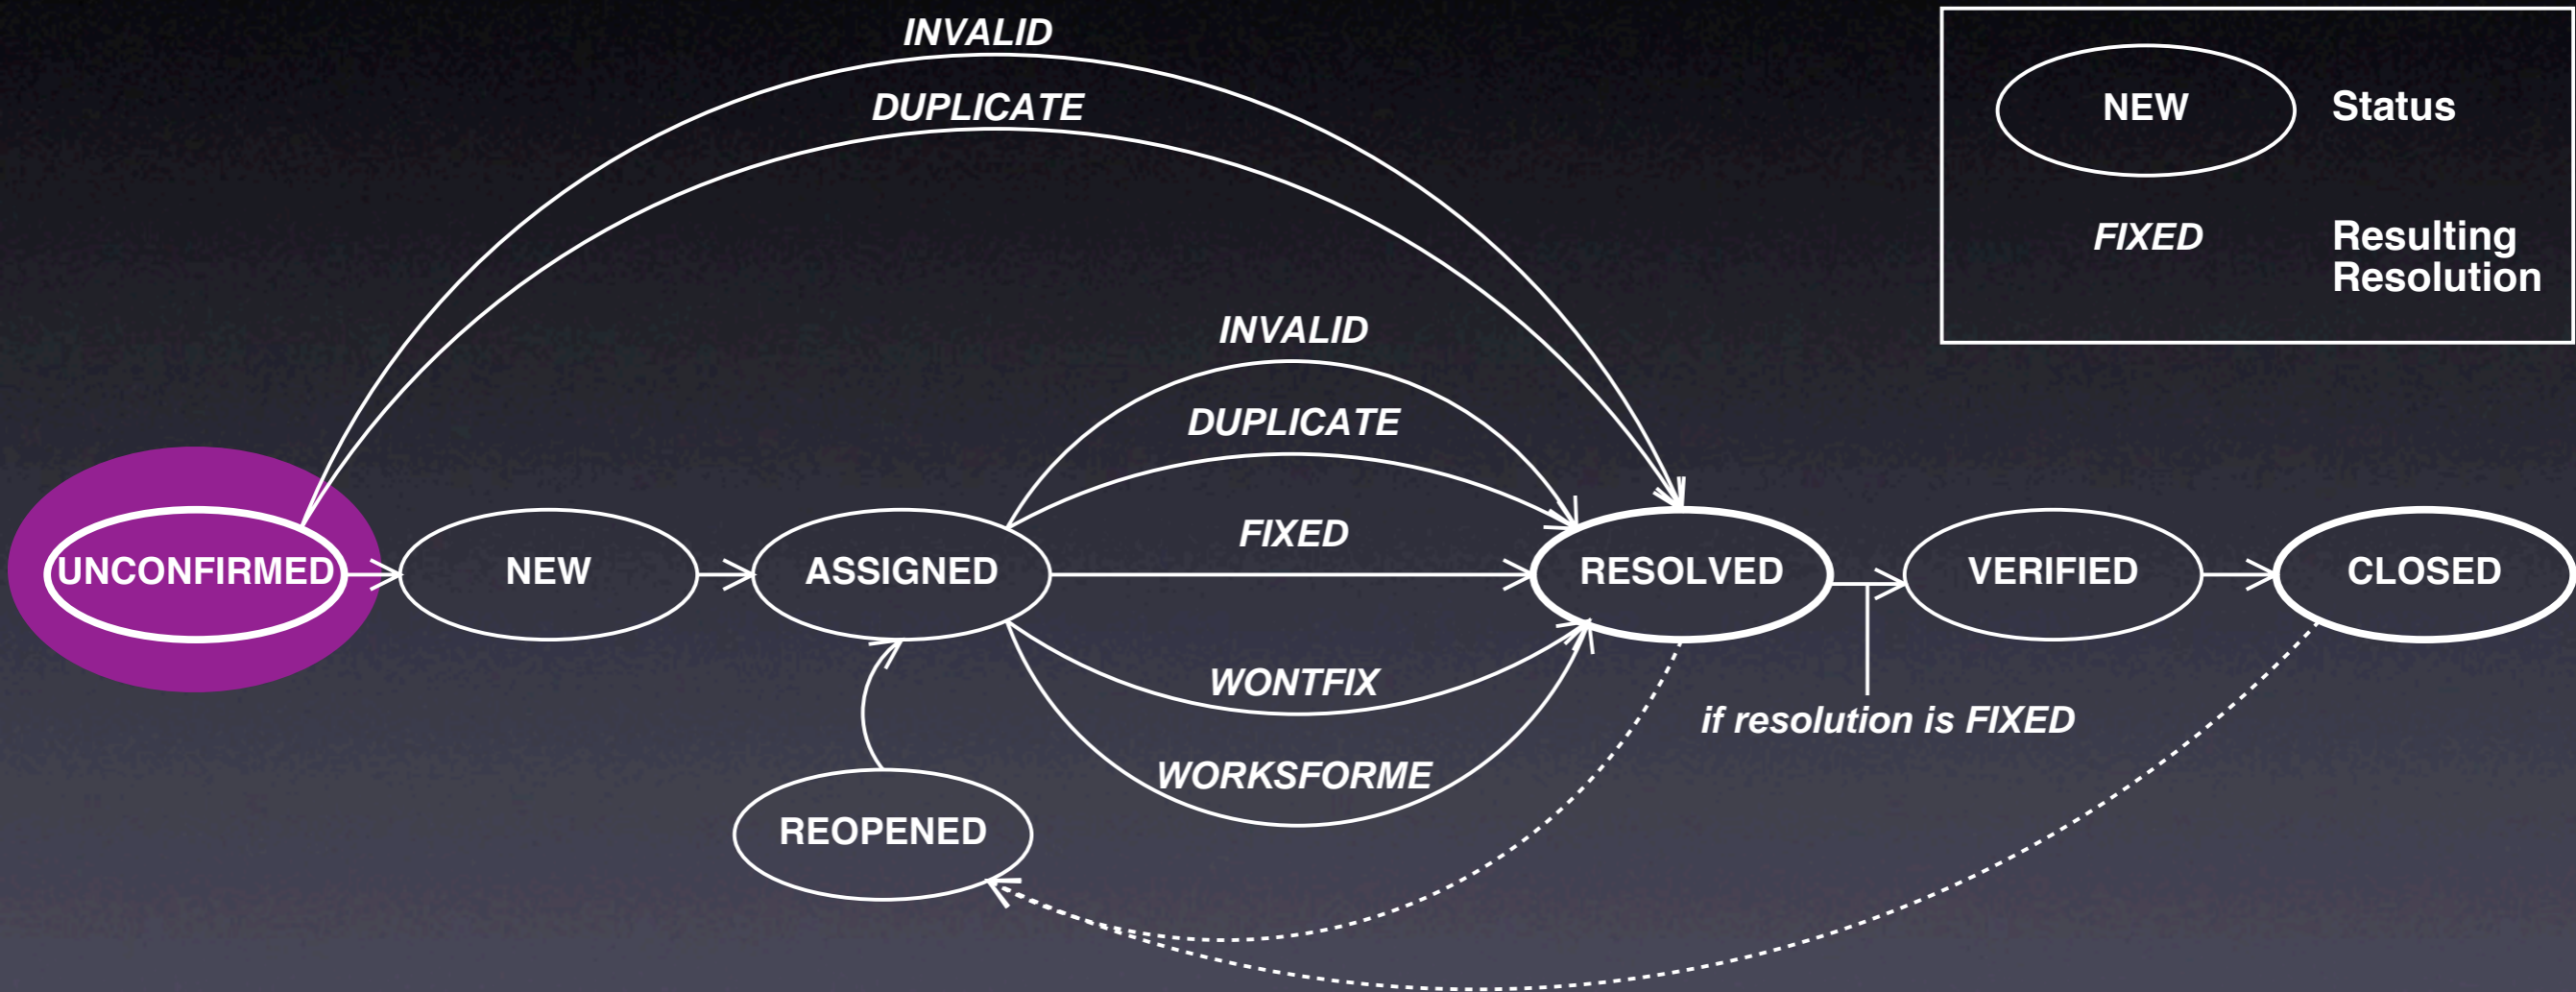

- Developers can attach an e-mail address to a problem report; they will be notified every time the report changes.
- Users can do so, too.

# The Problem Lifecycle

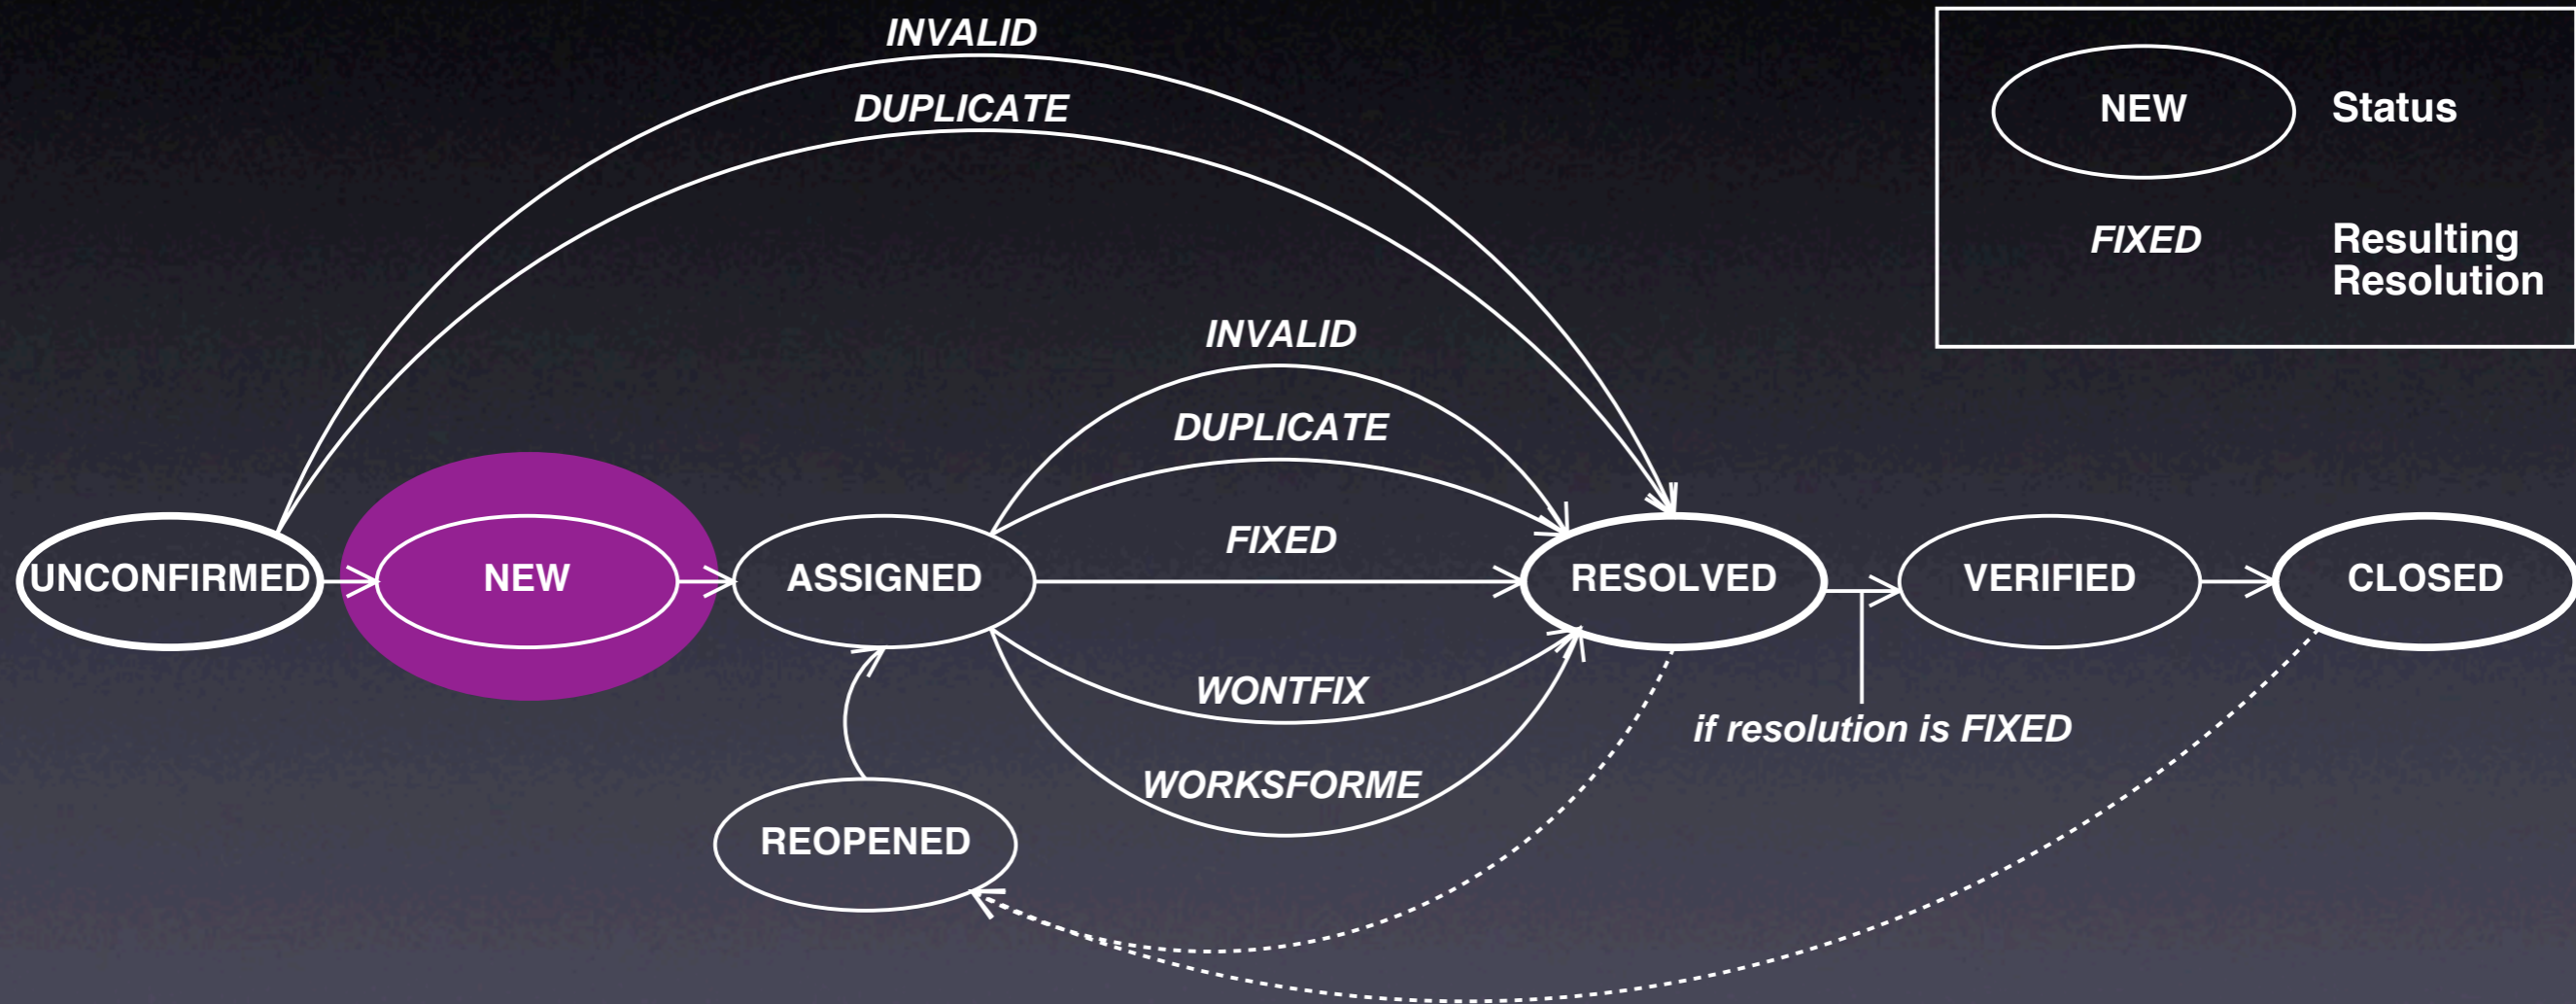

# Unconfirmed Problem

- The problem report has just been entered into the database

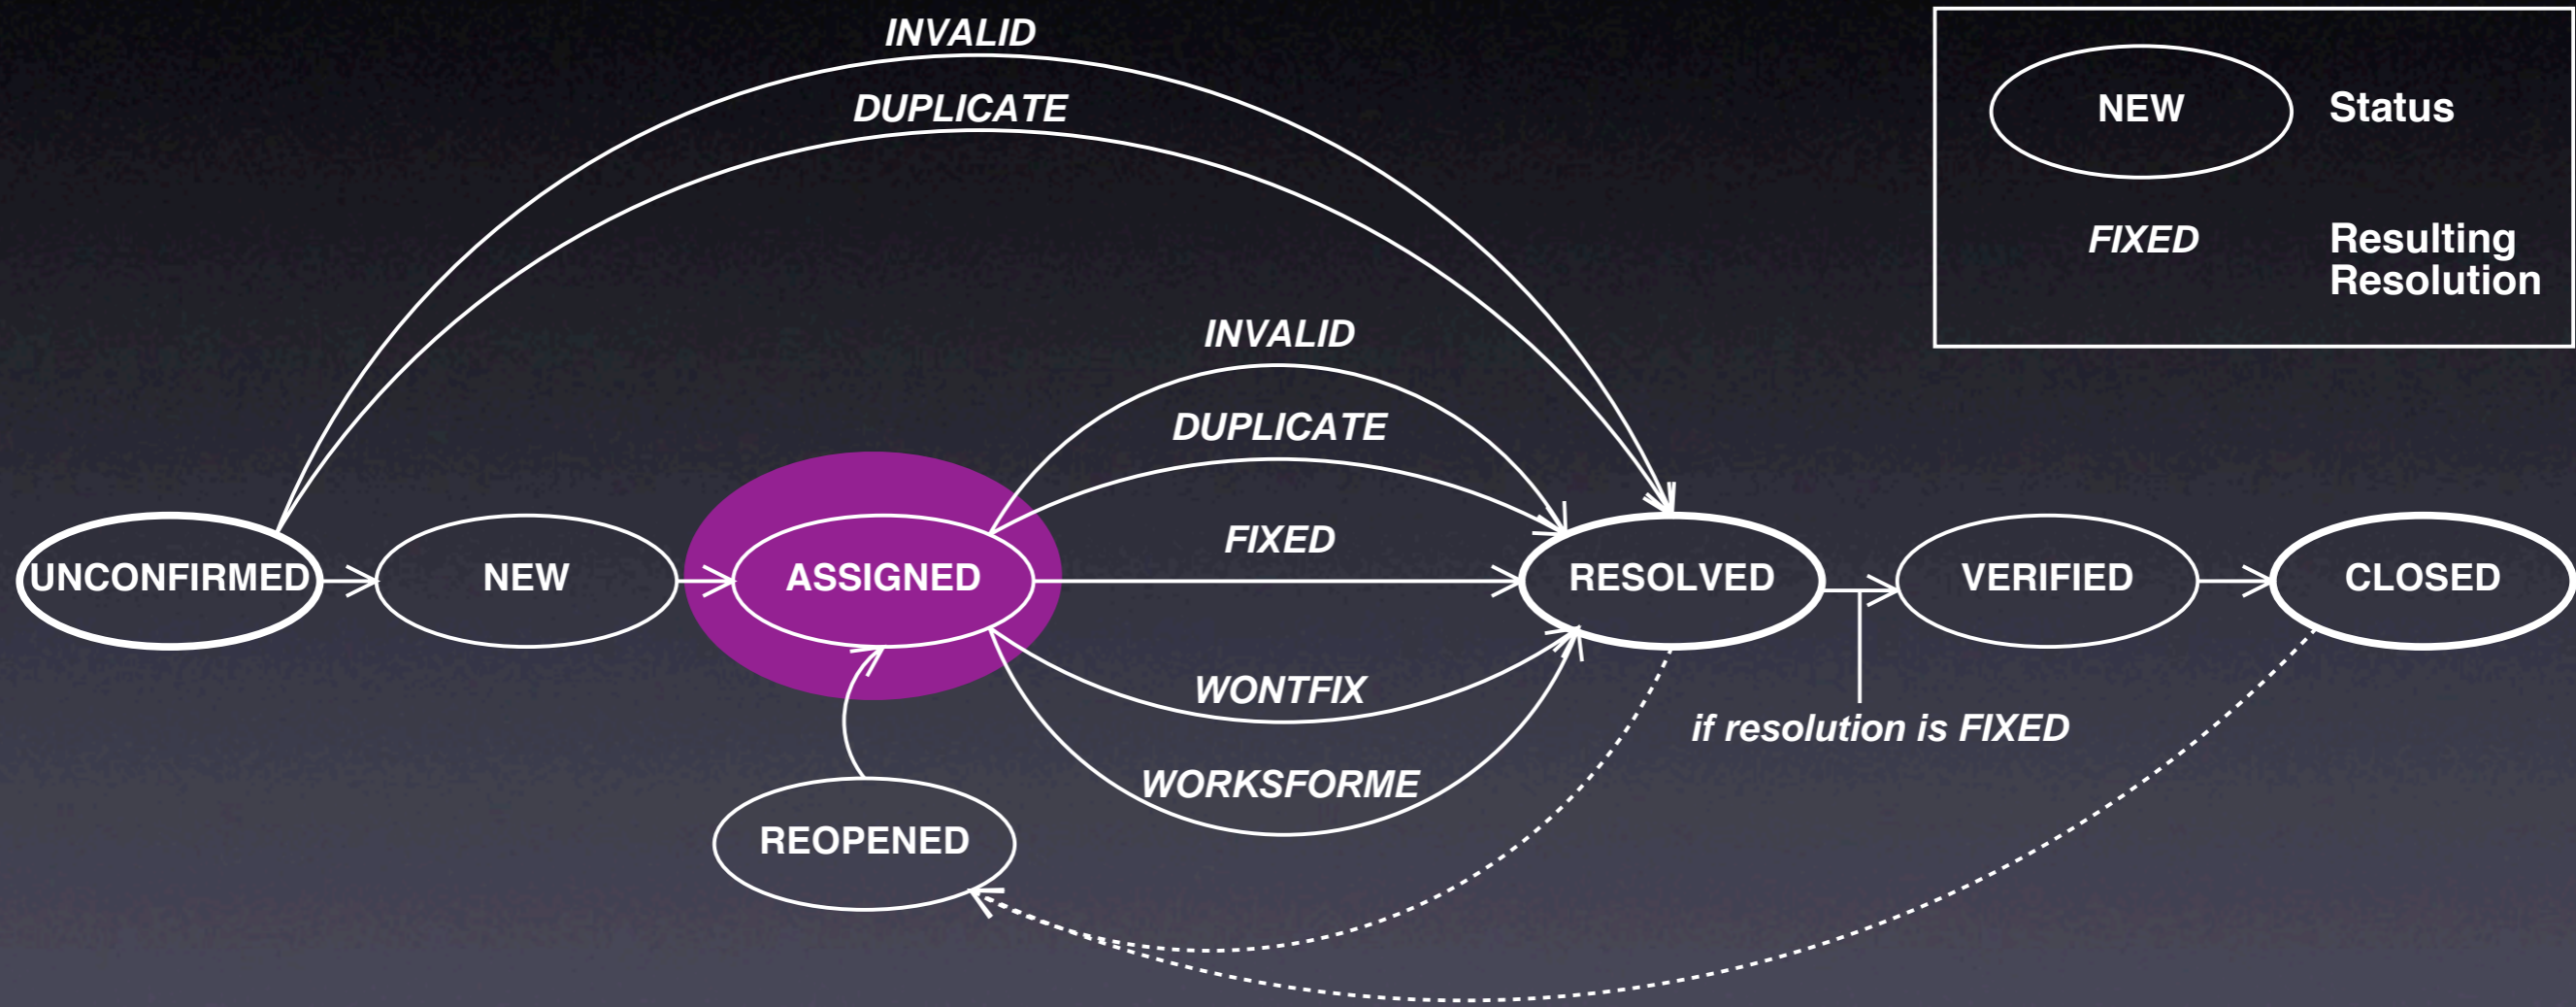

# New Problem

- The report is *valid* and not a *duplicate*.  
(If not, it becomes *resolved*.)

# Assigned Problem

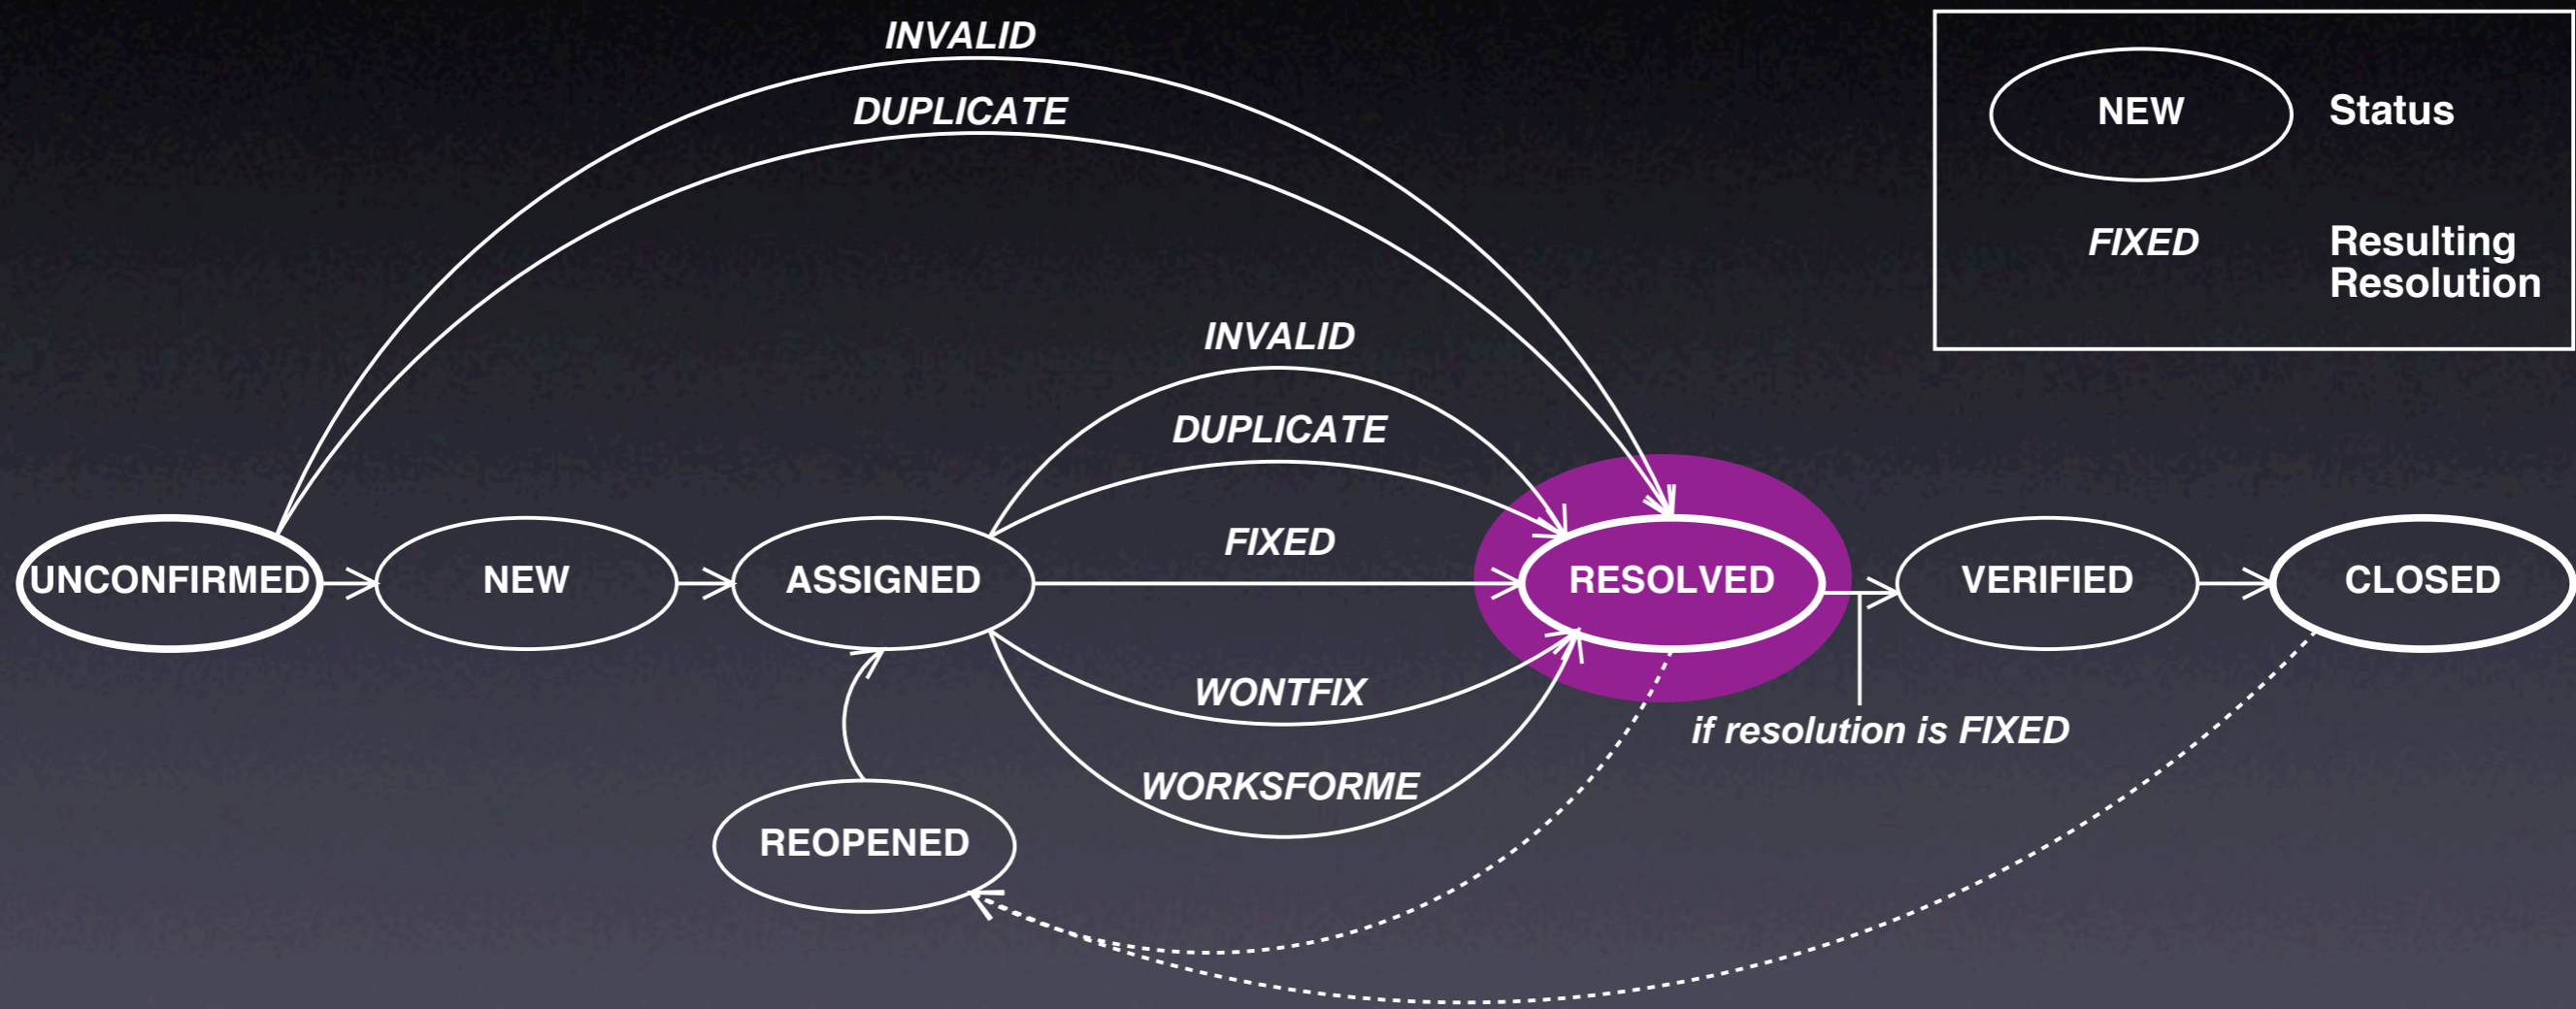

- The problem is assigned to a developer

# Resolution

- **FIXED**: The problem is fixed.
- **INVALID**: The problem is not a problem.
- **DUPLICATE**: The problem already exists.
- **WONTFIX**: Will never be fixed (for instance, because the problem is a feature)
- **WORKSFORME**: Could not be reproduced.

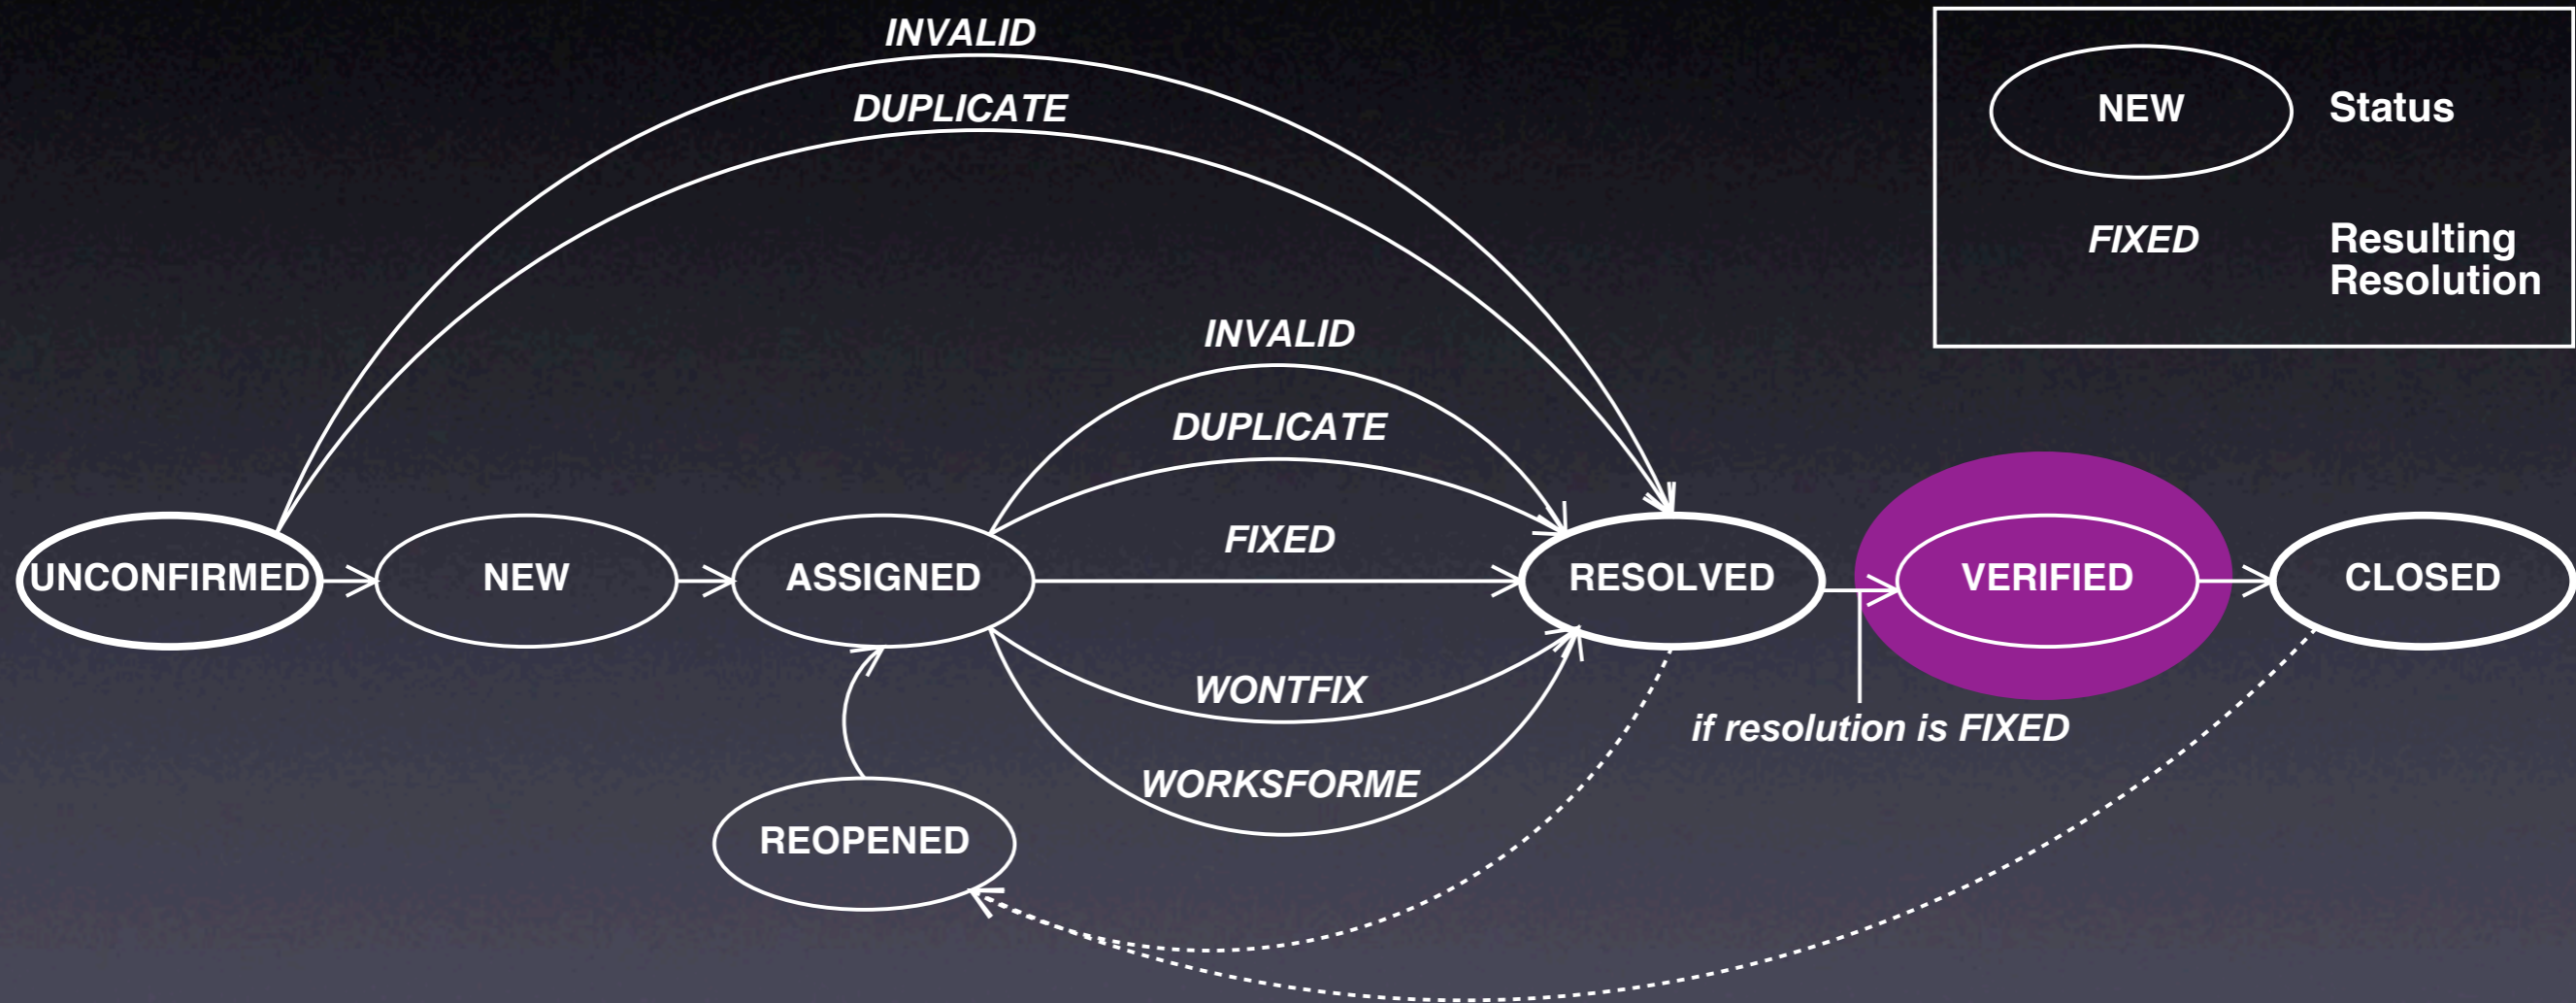

# Resolved Problem

- The problem report has been processed.

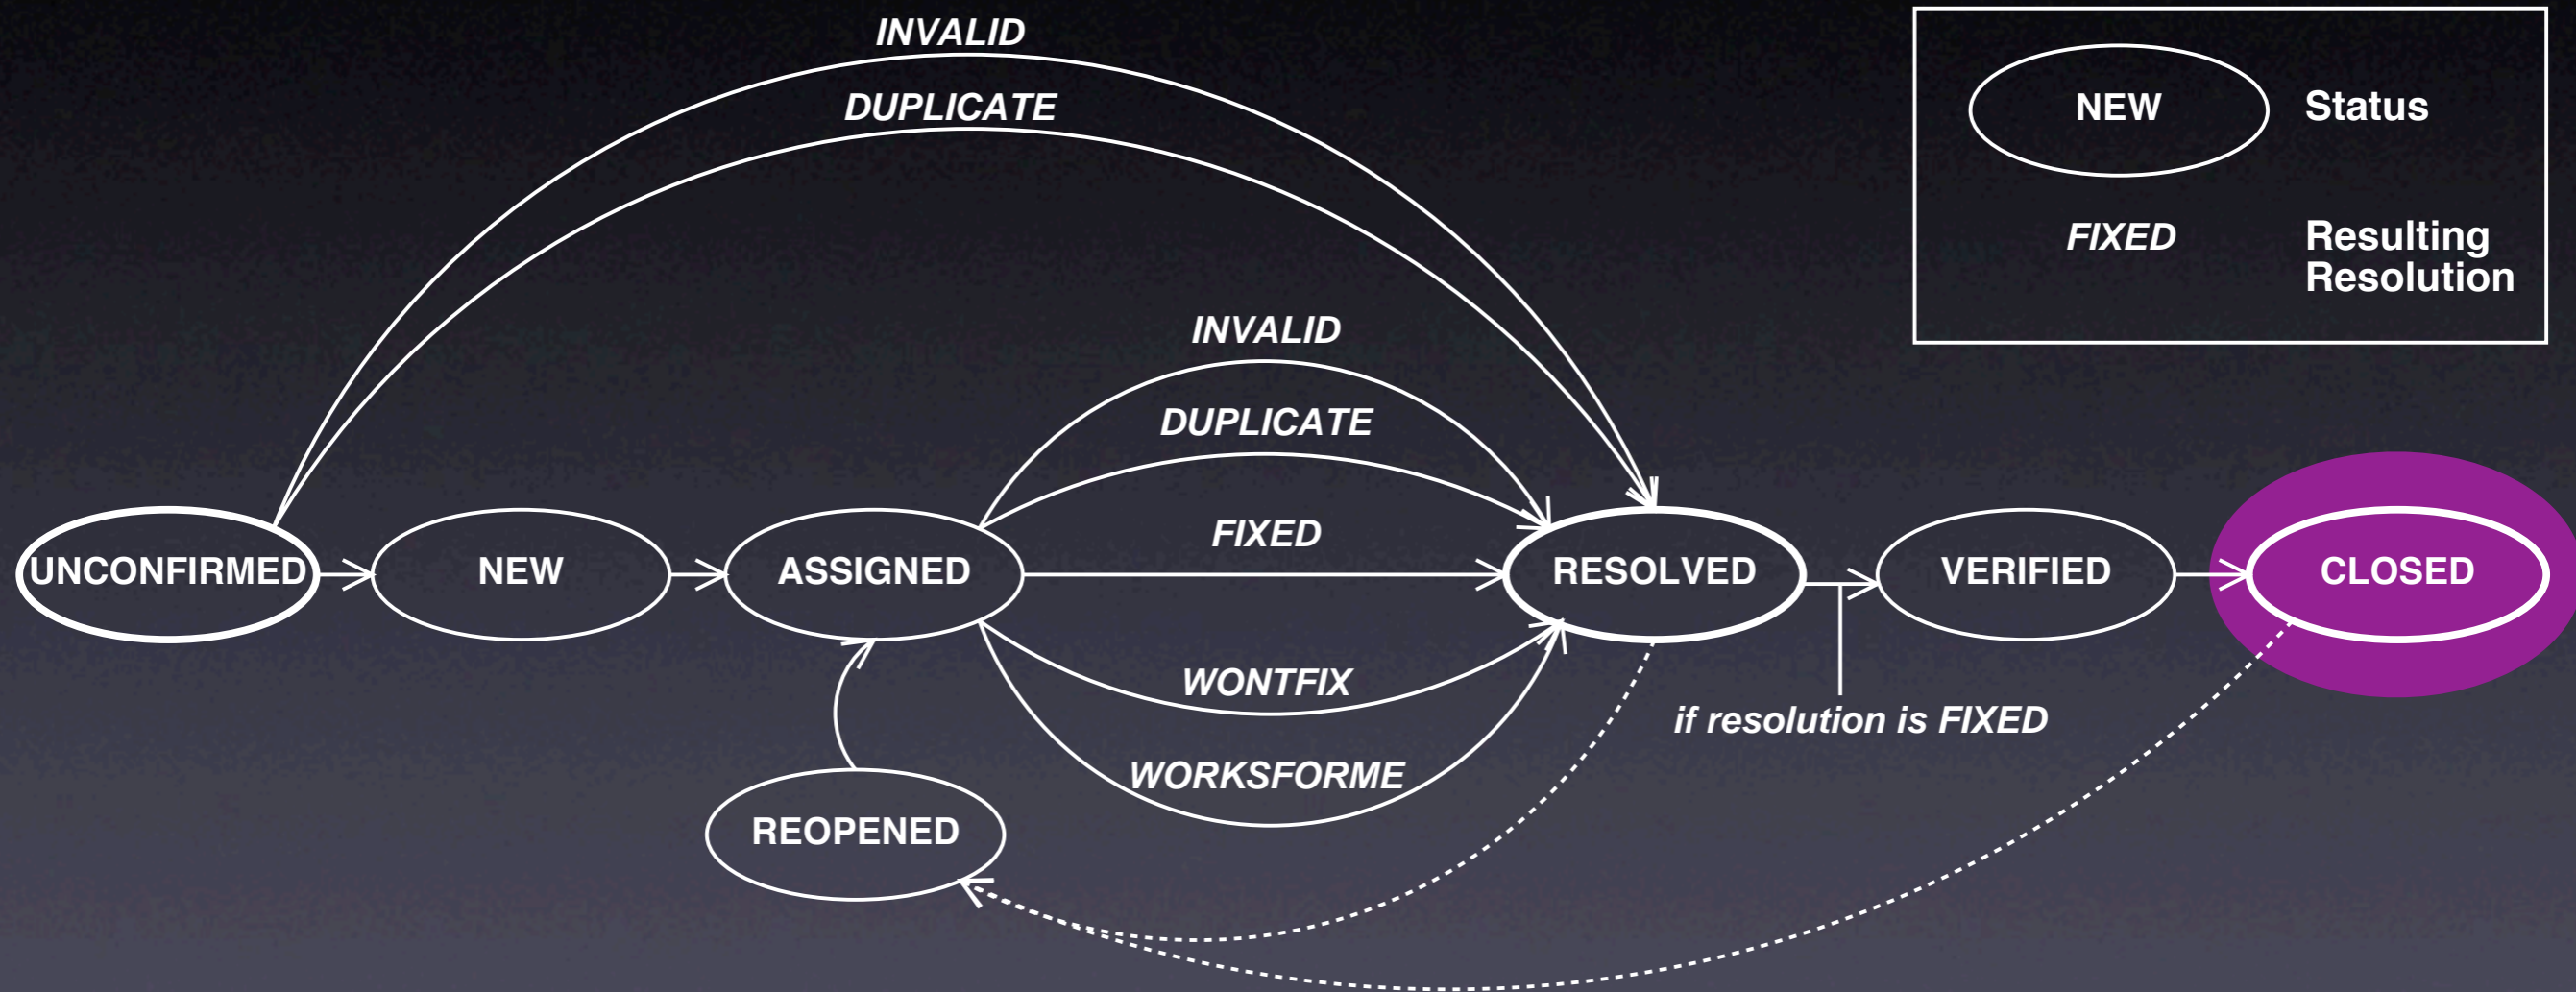

# Verified Problem

- The problem is fixed; the fix has been successful.

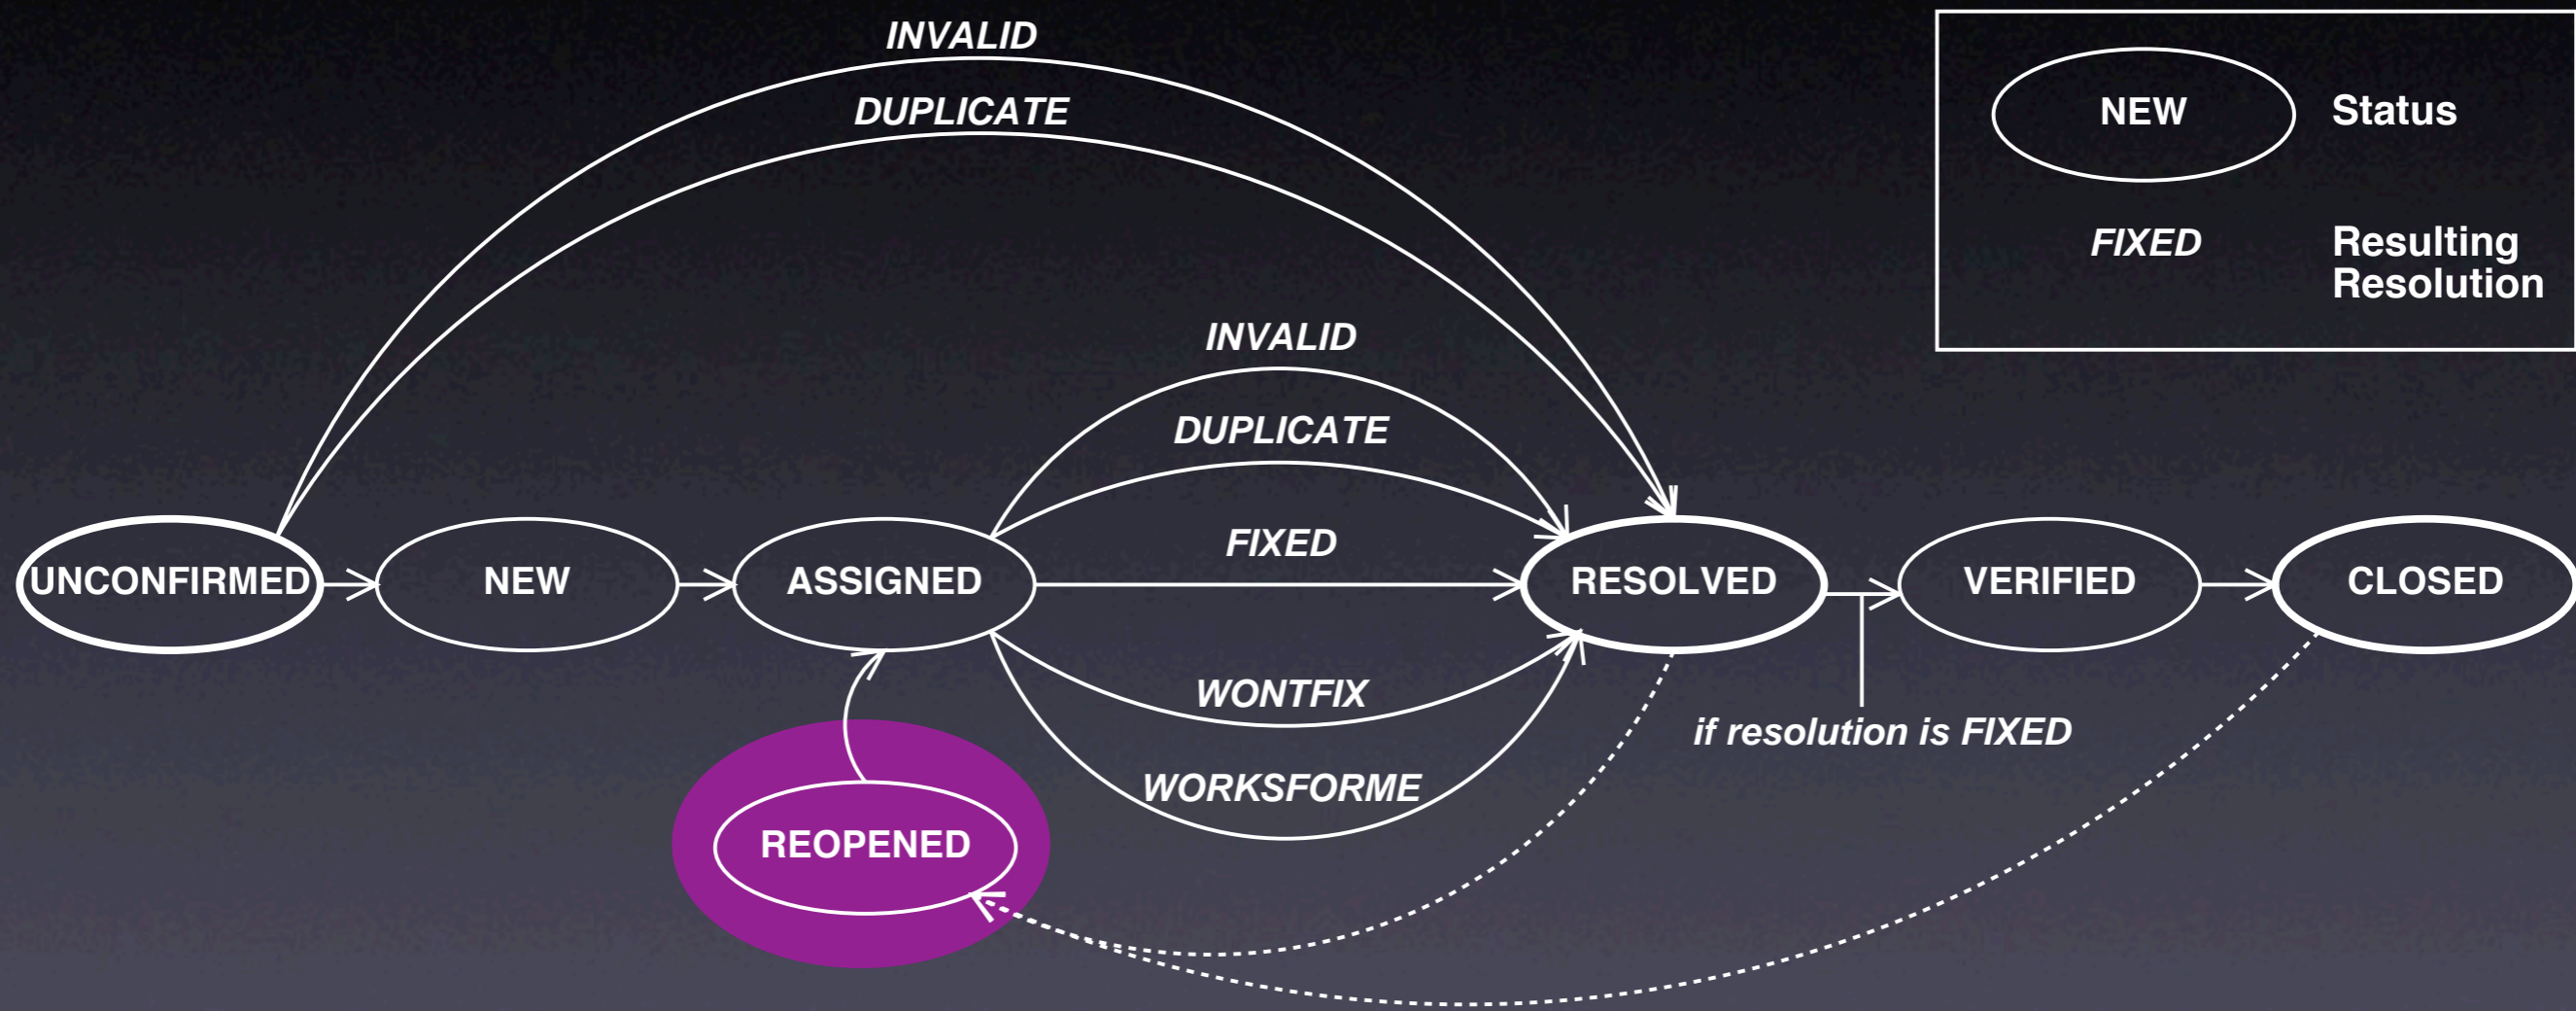

# Closed Problem

- A new version with the fix has been released.

# Reopened Problem

- Oops – there we go again :-)

# Management

- Who *enters* problem reports?
- Who *classifies* problem reports?
- Who sets *priorities*?
- Who takes care of the problem?
- Who *closes* issues?

# The SCCB

- At many organizations, a *software change control board* is in charge of these questions:
  - Assess the *impact* of a problem
  - Assign tasks to developers
  - Close issues...

# Problem-driven Development

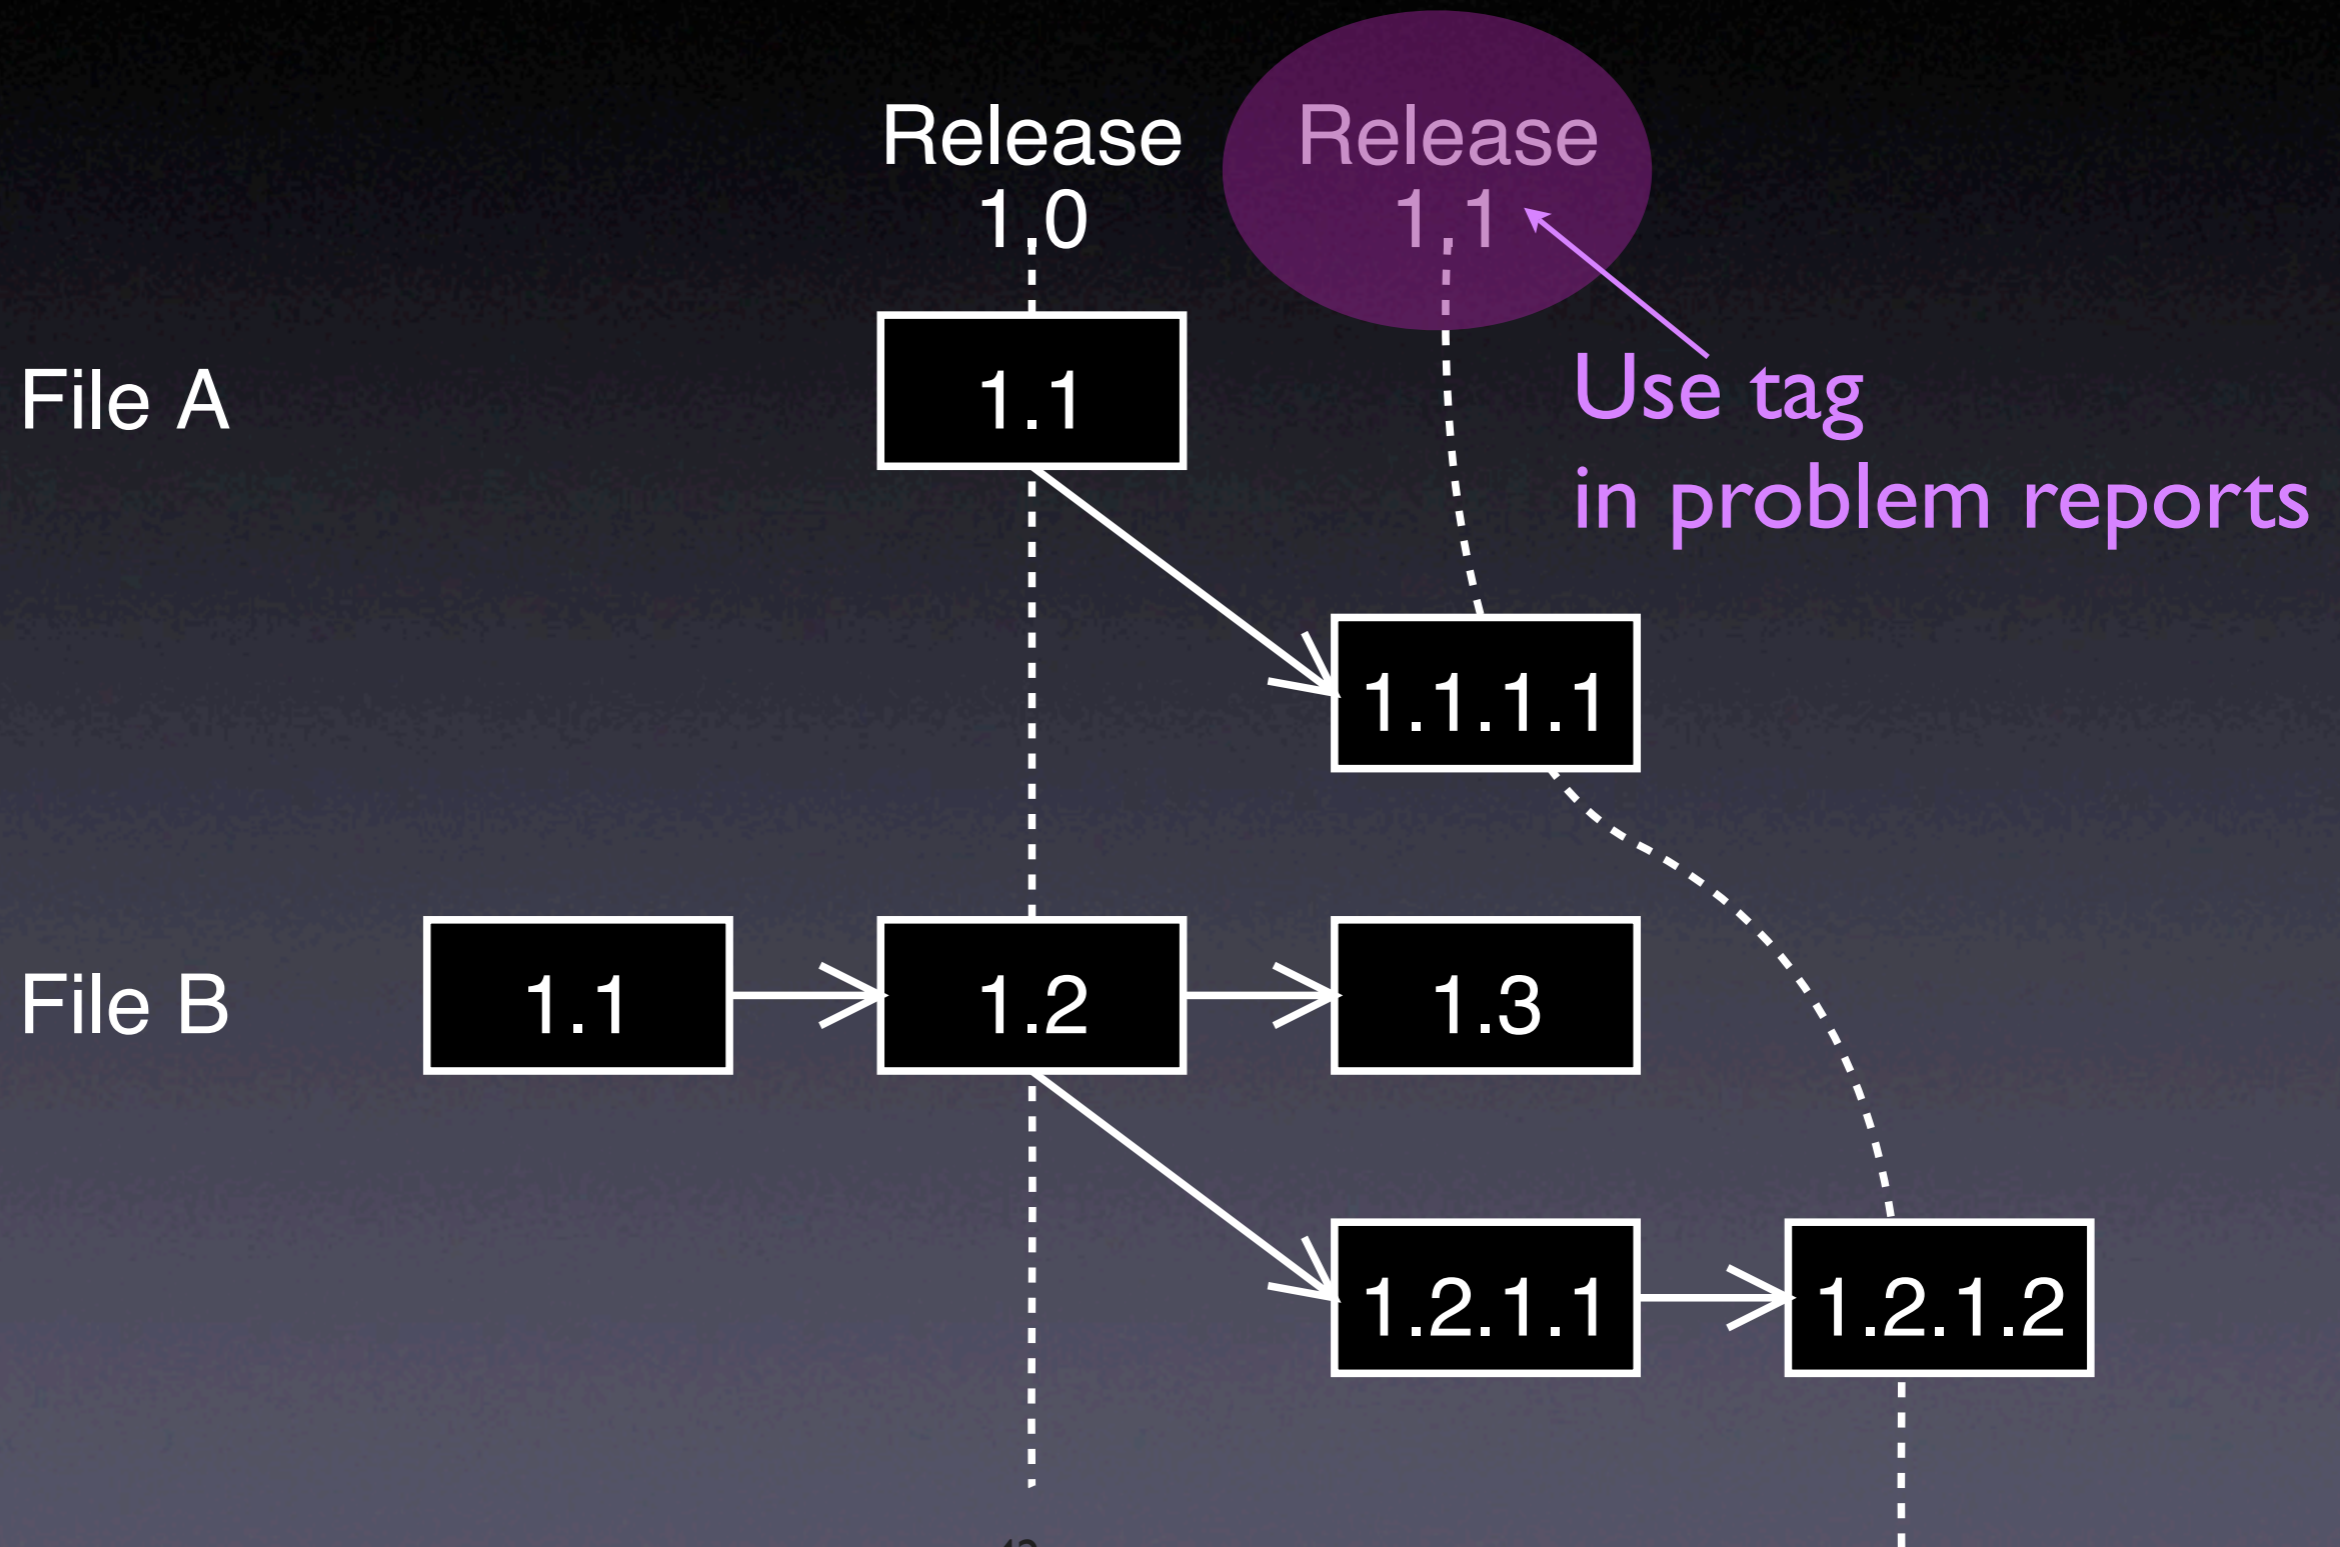

- The whole development can be organized around the problem database:
  - Start with one single problem:  
“The product isn’t there”
  - Decompose into sub-problems
  - Ship when all problems are fixed

# Managing Clutter

- Large problem databases contain *garbage*
- Get rid of *duplicates* by
  - simplifying bug reports
  - asking submitters to search first
- Get rid of *obsolete* problems by searching for old ones that rarely occurred

# Problems and Fixes

# Problems and Tests

- Some test fails. Should we enter the problem into the database?
- *No*, because test cases make problem reports obsolete.
- Once we can repeat a problem at will, there is no need for a database entry

# Concepts

- ★ Reports about problems encountered in the field are stored in a *problem database*.
- ★ A problem report must contain everything relevant to reproduce the problem.
- ★ It is helpful to set up a standard set of items that users must provide (product release, operating environment...)

# Concepts (2)

- ★ An effective problem report...
  - *is well-structured*
  - *is reproducible*
  - *has a descriptive one-line summary*
  - *is as simple and general as possible*
  - *is neutral and stays with the facts.*

# Concepts (3)

- ★ A typical problem life cycle starts with an *unconfirmed* status
- ★ It ends with a *closed* status and a specific *resolution* (such as *fixed* or *worksforme*)
- ★ Typically, a *software change control board* organizes priorities and assignments

# Concepts (4)

- ★ Use *version control* to separate fixes and features during development.
- ★ Establish conventions to relate *changes* to *problem reports* and vice versa.
- ★ Make a problem report *obsolete* as soon as a test case exists.
